In this article, we analyse an outbreak of RSV that affected 20 infants hospitalised in a neonatal unit NU and the measures taken to control the spread of infection. Finally, we were only able to stratify risk based on the factors available in our data set.

A descriptive analysis of the cases and a multivariate analysis was performed. CiteScore measures average citations received per document published. Save Preferences. Overall, admission rates during the 6-year study period increased from

Further, the effectiveness of this "volume-based referral initiative" appears on the other hand using the recorded reason on admission demonstrates which presenting symptoms are causing term neonates to be admitted in the first place. In addition, van der Pal et al, 51 in the Newborn Individualized Developmental Care and Assessment Program, found that fathers were more stressed when they were involved in childcare, such as being informed about tubes, the behavior of their infants, and signals of pain and distress.
